

About this document

Scope and purpose

The purpose of this document is to guide a beginner to use the OPTIGA™ Trust M XMC4800 IoT Connectivity kit. The scope is limited to OPTIGA™ Trust M XMC4800 IoT Connectivity kit and its hardware and software components.

Intended audience

This document addresses: customers, solution providers and system integrators.

2 OPTIGA™ Trust M

OPTIGA™ Trust M is a security solution with a pre-programmed security controller with wide range of security features.

It supports secure data, key and metadata object update, hibernate and cryptographic toolbox functionalities, secure communication, platform integrity, data store protection and lifecycle management for Connected Device Security.

2.1 OPTIGA™ Trust M XMC4800 IoT Connectivity kit

OPTIGA™ Trust M XMC4800 IoT Connectivity kit is designed to provide all the components required to setup the environment to demonstrate the features of the OPTIGA™ Trust M.

2.1.1 Evaluation Kit Components

Table 3 Evaluation Kit contents

No.	Item	Description
1	XMC4800 board	Hardware Evaluation board for XMC4800 microcontroller from Infineon. More details can be found on Infineon website.
2	My IoT Adapter	Arduino compatible connector to add Shield2Go board on XMC4800 IoT Connectivity Kit.
3	OPTIGA™ Trust M Security Shield2Go	Shield2Go board contains OPTIGA™ Trust M chip. It is compatible with Infineon's My IoT adapter.
4	WIFI ESP Click	WIFI hardware module, which can be integrated with XMC4800 microcontroller.
5	Micro USB to USB cable	The cable provides DC supply to XMC4800 IoT Connectivity Kit and to flash software.

2.2 Installed Software Components

The installed directory structure of OPTIGA™ Trust M setup software is shown below:

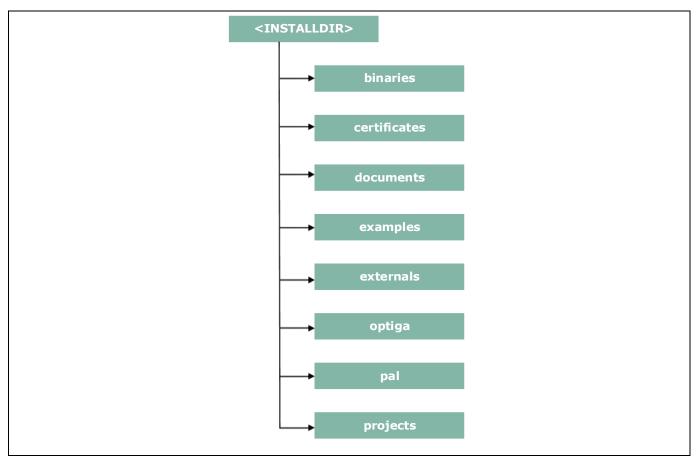

Figure 1 Installed directory structure

<INSTALLDIR> is the root directory to which the release package contents are extracted. The following section explains the contents of each subdirectory under installed directory:

- 1. **binaries** -- binaries for OPTIGA™ Trust M example application.
- 2. **certificates** -- OPTIGA™ Trust M certificates.
- 3. **documents** -- Relevant OPTIGA™ Trust M documentation.
- 4. **examples** example use cases for Toolbox features and a tool for generation of manifest and fragment for protected update feature.
- 5. **externals** -- mbedtls software crypto library.
- 6. **optiga** -- OPTIGA™ Trust M libraries.
- 7. pal -- PAL for XMC4800 device and PAL for mbedtls software crypto library.
- 8. **projects** -- XMC4800 device example project in DAVE workspace.

infineon

System Setup

3 System Setup

This section explains the basic components required for system setup.

3.1 System Overview

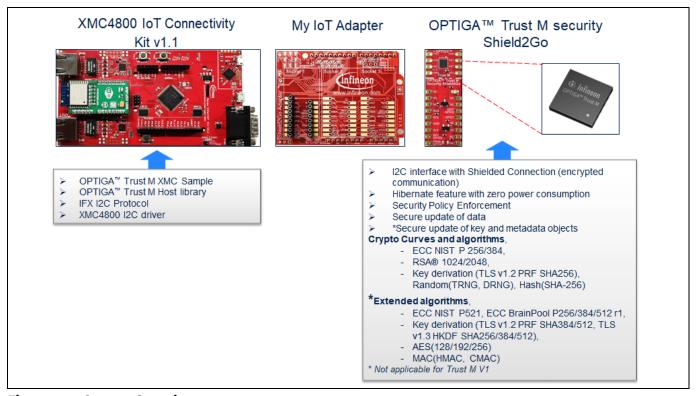

Figure 2 System Overview

This system consists of the following components:

- 1. XMC4800 IoT Connectivity Kit v1.1 from Infineon
 - The XMC4800 IoT Connectivity Kit is an evaluation board with XMC4800 Microcontroller from Infineon. For more information refer document [1].
 - It can connect to a WiFi access point using WiFi ESP click module.
 - It is used as a reference platform to simulate the Host.
 - It interacts with secure element via I2C.
- 2. My IoT Adapter
 - It acts as a gateway to add Shield2Go boards onto XMC4800 IoT Connectivity Kit V1.1.
- 3. OPTIGA™ Trust M Security Shield2Go
 - Shield2Go board contains OPTIGA™ Trust M chip. It is compatible with Arduino Uno along with Infineon's My IoT adapter.

The following interface/connection is done among the above components:

Micro USB data cable (with Data line) from PC is connected to XMC to supply power.

3.2 Hardware Setup

The hardware required to run OPTIGA™ Trust M setup is described in this section.

System Setup

3.2.1 XMC4800 IoT Connectivity Kit

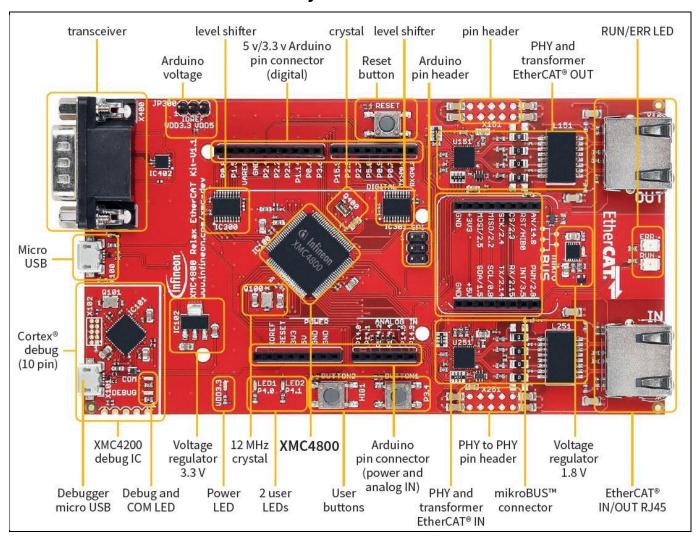

Figure 3 XMC4800 IoT Connectivity kit

Table 4 XMC4800 IoT Connectivity kit connection

No.	Item	Description	
1	Debugger micro USB	Power supply of 5V is provided by connecting to Micro USB cable.	
2	Arduino pin connector	External interface to connect to Arduino compatible Shields.	
3	mikroBUS connector	Socket to connect WiFi ESP click module from MikroElektronica.	
4	Micro USB	UART communication for debugging and logging purposes (VCOM).	

The pin headers for Arduino shields can be used for GPIOs or signal interface as well. Arduino compatible connector supports I2C, UART and SPI interfaces among others.

Table 5 XMC4800 IoT Connectivity kit Pin Information

No.	Description	Pin
1	I2C SCL	P0.8
2	I2C SDA	P1.5
3	RST	P0.6
4	VCC	P2.7
5	GND	GND

System Setup

For more information about pin details of Arduino shield, refer document [1].

For more information about the XMC Specification, Architecture and Design/Schematic, refer document [1]

3.2.2 My IoT Adapter

The My IoT adapter is an evaluation board that allows users to easily combine different Shield2Go boards to Arduino compliant ecosystem, for fast evaluation of IoT systems. With its solderless connectors, it allows users to easily stack Shield2Go boards instead of soldering it. The shield design is derived from XMC2Go evaluation board.

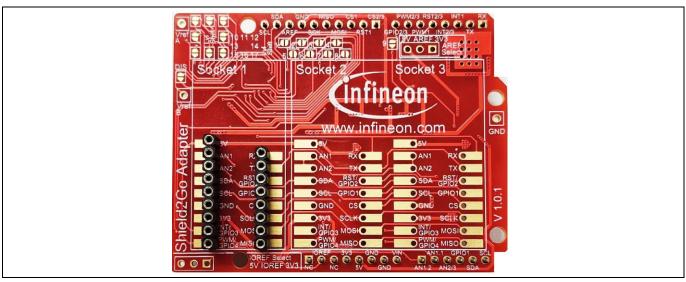

Figure 4 My IoT adapter

My IoT adapter features are as follows:

- Provide power supply and connectivity for Shield2Go boards.
- Level shifting handling capabilities between CMOS 3.3V and TTL 5V.
 - Solder bridges to selectively deactivate level shifting.
 - Additional pins enable setting the reference voltages for level shifting.
- Separate power control switches for Socket 1 and Socket 2. Socket 1 is independently controllable while Socket 2 and 3 share pins to underlying control board.

More information is available at Infineon website.

3.2.3 Shield2Go Security OPTIGA™ Trust M

Shield2Go boards are equipped with featured Infineon ICs and provide a standardized form factor and pin layout, allowing a 'plug and play' approach for easy prototyping.

System Setup

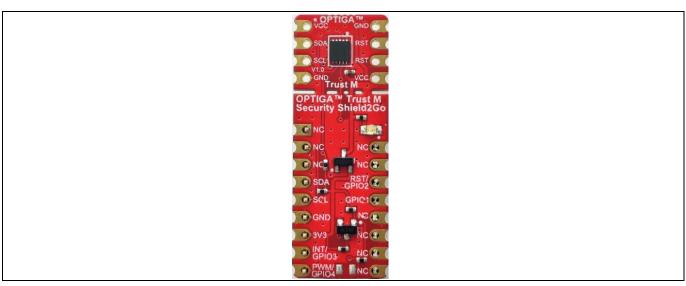

Figure 5 OPTIGA™ Trust M Shield2Go

The OPTIGA™ Trust M Shield2Go is equipped with OPTIGA™ Trust M security chip. It allows users to develop system solutions by combining Shield2Go with My IoT adapter and XMC.

Note: Ensure no voltage supplied to any of the pins exceeds the absolute maximum rating of V_{cc} + 0.3 V.

3.3 **Software Setup**

This section describes the software used in XMC to run the OPTIGA™ Trust M setup.

3.3.1 **Software Components**

All the software components required on XMC are explained in the following sections.

XMC4800 IoT Connectivity Kit 3.3.1.1

- 1. OPTIGA™ Trust M Host Library consists of the following:
 - Service Layer
 - The layers (Util and Crypt) provide APIs to interact with OPTIGA™ for various use-case functionalities.
 - Access Layer
 - This layer manages the access to the command interface of OPTIGA™ security chip. It also provides the communication interface to the OPTIGA™.
 - Platform Abstraction Layer
 - This layer provides platform agnostic interfaces for the underlying HW and SW platform functionalities used by OPTIGA™ libraries.
 - Platform Layer
 - This layer provides the platform specific components and libraries for the supported platforms.
- 2. IFX I2C Protocol
 - This is an implementation as per document [2].
- 3. XMC4800 I2C Driver
 - These are low level I2C device driver for I2C communication from XMC to OPTIGA™ Trust M Security chip.
- 4. OPTIGA™ Trust M XMC Example

System Setup

This Example Application demonstrates Secure Data Object, Key and Metadata update, pairing of host and OPTIGA using Pre-shared secret, Hibernate feature, Cryptographic Toolbox Functionalities and Read/Write General Purpose Data use cases.

Note: The binaries and the example application provided with the application note are meant for the XMC4800 IoT Connectivity Kit v1. These binaries may not work as expected if executed on a different platform.

3.3.2 **PC Requirements and Configurations**

3.3.2.1 **PC Requirement**

A 32-bit or 64-bit PC with Windows 7/10 Operating System with the below requirements need to be used for setting up the OPTIGA™ Trust M setup:

- 1. One USB port.
- 2. DAVE 4.4.2 and device feature 2.2.4, which can be downloaded from Infineon website. Link to download DAVE 4.4.2: <u>Dave Download</u>
- 3. Segger J-Link tool v6.00 or greater for flashing software on XMC.

Link to download Segger: J-Link tool Download Link to download manuai: J-Link manual Download

Note: The path where DAVE tool is extracted is henceforth referred to as <DAVE_PATH> in the document.

Note: All the tools mentioned in the above list are intended to be used with the binaries or source code given in the release package.

infineon

Using OPTIGA™ Trust M

4 Using OPTIGA™ Trust M

4.1 Quick Setup

This section explains the steps to run OPTIGA™ Trust M example application.

4.1.1 Running OPTIGA™ Trust M Example Application

1. Make the connections among XMC4800 IoT Connectivity Kit, My IoT Adapter and OPTIGA™ Trust M Shield2Go as shown below

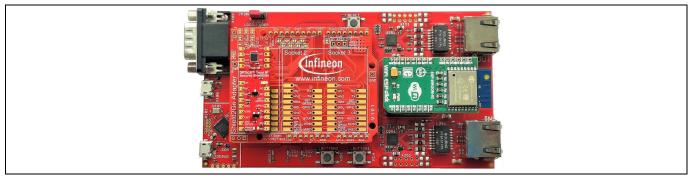

Figure 6 XMC4800 IoT Connectivity Kit, My IoT Adapter and OPTIGA™ Trust M Shield2Go connection

- 2. Power up the kit by connecting Micro USB cable between PC and Debugger micro USB. For placement of Debugger micro USB refer Figure 3.
- 3. Download the OPTIGA™ Trust M example application using JFlashLite tool as described in section 4.1.2.1. Hex file location is <INSTALLDIR>\binaries\xmc4800_iot_kit\dave4\xmc4800_optiga_example.hex.
- 4. OPTIGA™ Trust M example application uses USBD_VCOM for logging, refer section 4.1.3 for logging details.

4.1.2 Steps to download example hex file to XMC4800 Connectivity IoT Kit

4.1.2.1 Using JFlashLite tool

1. Run JFlashLite.exe from JLink installation folder. It shows a notice window. Click OK.

Figure 7 JFlashLite launch window

2. Click on Device to select a target device.

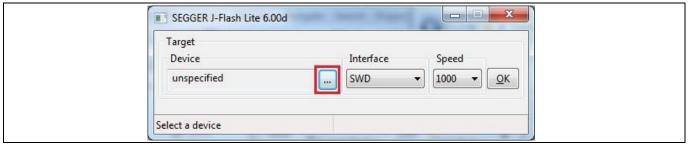

Figure 8 JFlashLite select a device

Using OPTIGA™ Trust M

3. Select Infineon as Manufacturer and Device as XMC4800-2048, and then click OK.

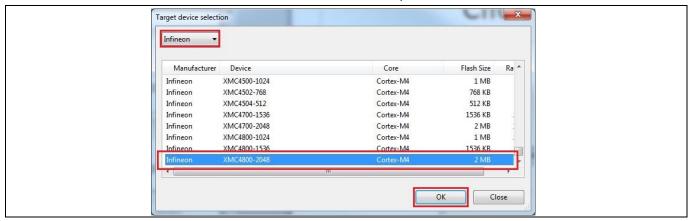

Figure 9 JFlashLite Target device selection

- 4. After target device selection, click OK on window shown in Figure 9.
- 5. Select hex file to be flashed under Data File and click on Program Device. It then shows the programming progress window.

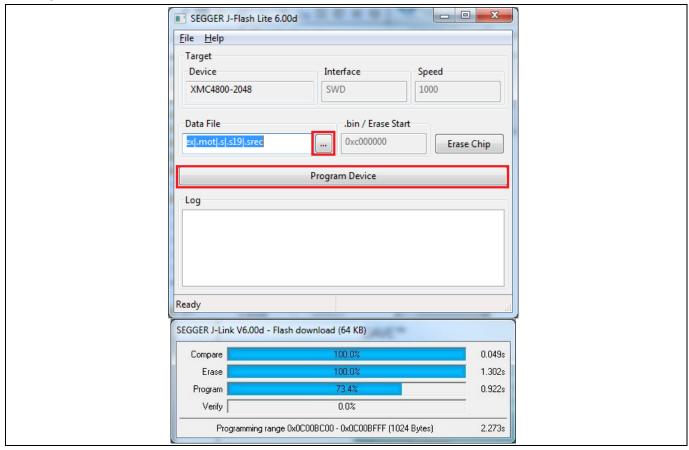

Figure 10 JFlashLite Hex file selection and programming progress window

6. Flash download completed.

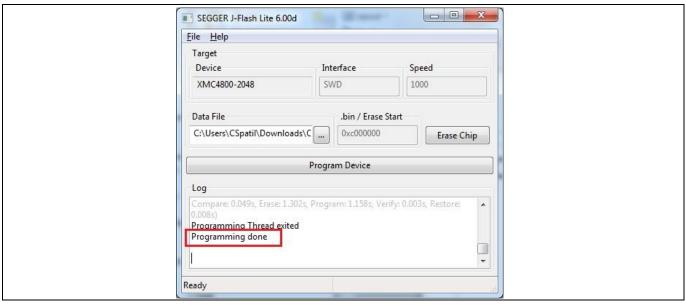

Figure 11 JFlashLite programming completion window

4.1.3 Logger

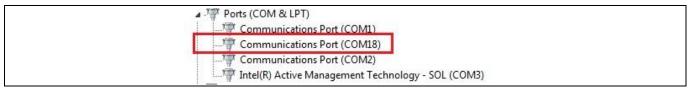

4.1.3.1 Logger setup

- 1. Connect the micro USB cable between PC and micro USB. For placement of micro USB refer Figure 3.
- 2. Reset the XMC4800 by pressing the reset button.
- 3. Select the COM port with name "Communications Port".

Note:

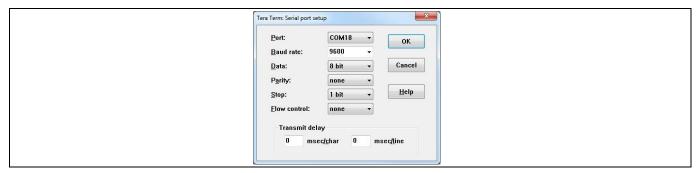

For binding the Windows serial driver(usbser.sys) with USBD_VCOM device user has to point to the driver.inf file in the folder path:

<INSTALLDIR>\projects\xmc4800_iot_kit\common\Dave\Generated\USBD_VCOM\inf\

Discovery of USB Serial Device COM port Figure 12

4. Configure COM port with 9600 8N1.

TeraTerm terminal serial configuration

- 5. Once connected, the terminal displays the text "Press any key to start optiga mini shell".
- 6. It will list down the available OPTIGA™ commands.

```
File Edit Setup Control Window Help
Press any key to start optiga mini shell

susage : optiga -<cmd>
initialize optiga
de-initialize optiga

Using OPTIGA™ Trust M

4.1.3.2 Logger control

By default only logging from example is enabled in the release package.

Further control for OPTIGA™ Trust M host code logging is available in optiga_lib_config.h.

The macro OPTIGA_LIB_ENABLE_LOGGING provides complete control to enable/disable logging at host code. In addition, logging at UTIL, CRYPT, CMD and COMMS layer can be controlled using the following macros,

- OPTIGA_LIB_ENABLE_UTIL_LOGGING
- OPTIGA_LIB_ENABLE_CRYPT_LOGGING
- OPTIGA_LIB_ENABLE_CMD_LOGGING
- OPTIGA_LIB_ENABLE_COMMS_LOGGING

For Example,

- 1. To enable logging for only COMMS layer, enable OPTIGA_LIB_ENABLE_COMMS_LOGGING and disable rest all layer macros.
- 2. Build and run the project as described in section 4.2.

Figure 17 Logging data with only COMMS layer enabled

Execution time of example increase if more logging information is printed. Note:

4.2 Advanced Setup

This section explains the steps to build and run OPTIGA™ Trust M example application.

4.2.1 Setting up DAVE™ IDE on PC

- 1. Refer to the installation guide in <DAVE_PATH> to install DAVE™ on your PC.
- 2. Start DAVE[™] from <DAVE_PATH>\eclipse\DAVE.exe. The following splash screen will appear:

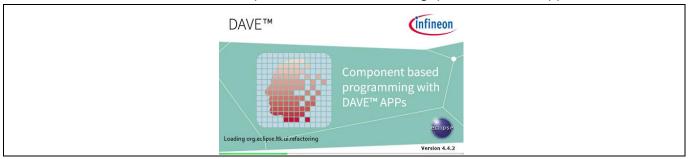

Figure 18 Opening DAVETM

3. Eclipse Launcher will pop-up. Select the workspace for DAVE™.

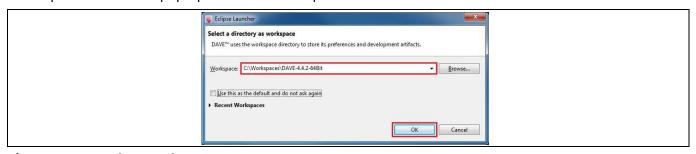

Figure 19 Select workspace

4. DAVE IDE Perspective window.

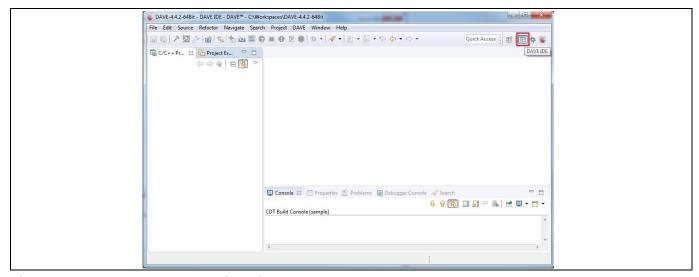

Figure 20 DAVE IDE Perspective window

4.2.2 Running OPTIGA™ Trust M Example Application Project with DAVE™

- 1. Make the connections between XMC4800 IoT Connectivity Kit, My IoT Adapter and OPTIGA™ Shield2Go. Refer Figure 6.
- 2. Power up the kit by connecting Micro USB cable between PC and Debugger micro USB. For placement of Debugger micro USB refer Figure 3.
- 3. Import example application project into DAVE IDE, by navigating through **File -> Import.** In Import pop-up, select Existing Projects into Workspace under General and then click Next.

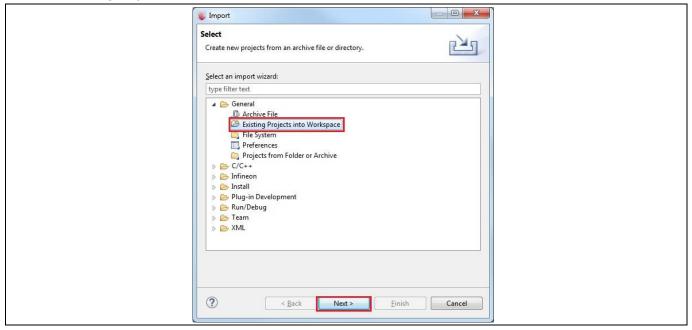

Figure 21 Import DAVE project window

4. Browse to **INSTALLDIR**>**projects****xmc4800_iot_kit****dave4** for Select root directory, select xmc4800_optiga_example and then click Finish.

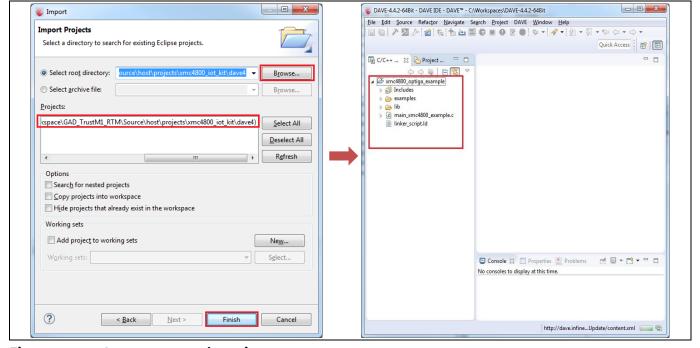

Figure 22 Import a example project

5. Set example project as an active project by right-click on project and select **Set Active Project**.

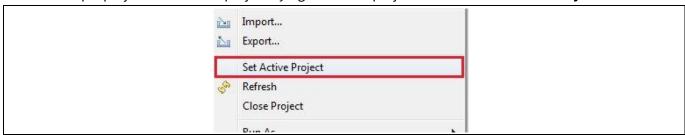

Figure 23 Example project set as active project

6. Select the build configuration by right-click on example project and then select **Build Configurations -> Set** Active -> Debug. To select Release build configuration, select Build Configurations -> Set Active -> Release.

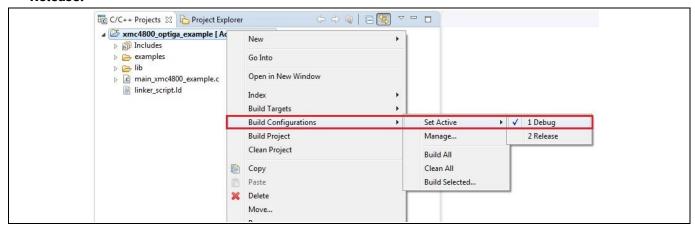

Figure 24 **Build configuration selection**

7. Build the project in Debug/Release configuration. It should be error free.

Figure 25 Example build in debug

8. Before launching the debugger, ensure that values are properly updated for variables like jlink_gdbserver and jlink_path. Navigate through Window -> Preferences -> Run/Debug -> String Substitution and update values as shown in the figure below:

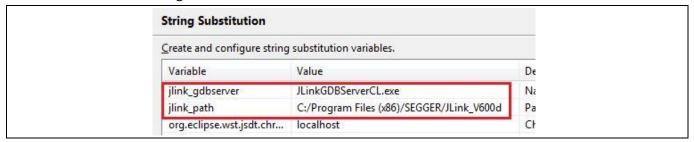

Figure 26 J-Link variable mapping

9. Launch debugger for debug of example application by clicking on bug symbol.

Using OPTIGA™ Trust M

Figure 27 Debugger launch

10. Create a debug configuration and then click on Debug.

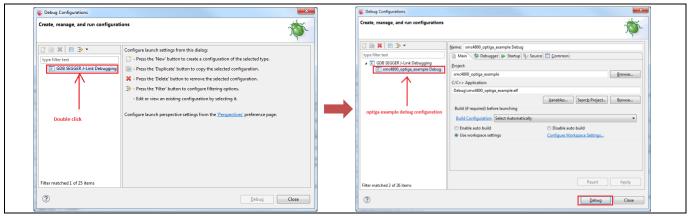

Figure 28 Creating a example debug configuration

11. If a window prompts to confirm the perspective switch, check the Remember my decision, and click yes.

Figure 29 Confirm perspective switch

12. Start the debugger.

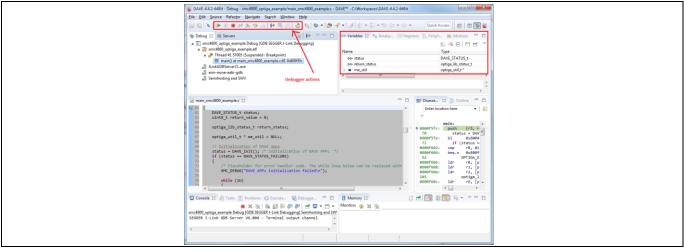

Figure 30 Starting a debug session

Using OPTIGA™ Trust M

- 13. Refer section 4.1.3.1 to setup USBD_VCOM for logger.
- 14. Example logs can be seen on terminal as shown in Figure 16.
- 15. To build project in release configuration, select the build configuration as **Release** as shown in Figure 24 and build the project again.
- 16. Create a new configuration by right-click on example project and Run As -> Run Configurations. Doubleclick on GDB SEGGER J-Link Debugging and select Release configuration then click on Run. The logs of the executing example can be seen on the terminal as shown in Figure 16.

Connect the USB cable to Debugger micro USB before running Release configuration. And use Note: Micro USB for logger.

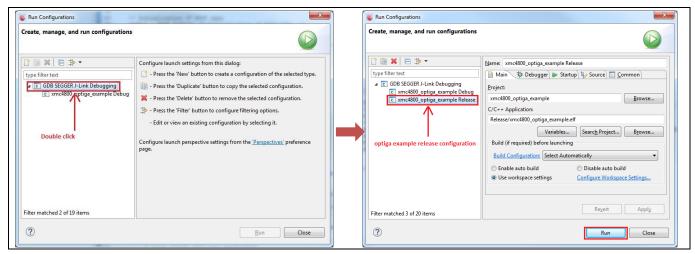

Figure 31 Run example with release configuration

17. To execute the example without shielded connection, disable the macro OPTIGA_COMMS_SHIELDED_CONNECTION in file optiga_lib_config.h.

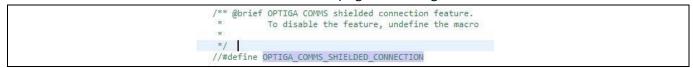

Figure 32 OPTIGA_COMMS_SHIELDED_CONNECTION disable

18. To run example application with logging for different layers refer to section 4.1.3.2.

Troubleshooting

Troubleshooting 5

Table 6 **Troubleshooting**

No	Problem	Reason	Solution
1	The Green LED light is "Not on" on XMC4800 IoT Connectivity kit	No power supply	Verify that power supply is connected to XMC4800 IoT Connectivity kit.
2	CDC port not detected	SW not correctly installed	In device manager, click on the malfunctioning CDC port and select to manually install the driver. Provide directory as C:\ for path to install the driver.
3	Problem occurred during debugger launch	Debug session is not terminated	Go to Debug perspective and remove all terminated launches.
		Jlink path not updated	Refer [8] for correctly updating the path
